VMware vSphere Storage Appliance Installation and Configuration

*VMware vSphere Storage Appliance Installation and Configuration* helps you install and configure VMware ESXi™, VMware vCenter Server™, and VMware vSphere® Storage Appliance to create a VSA cluster. A VSA cluster enables VMware vSphere® vMotion and VMware vSphere® High Availability without the need to install expensive SAN arrays.

**Intended Audience**

This book is intended for anyone who wants to enable vSphere vMotion and vSphere HA in their virtual environment. The information in this book is for experienced Windows system administrators who are new to virtual machine technology and datacenter operations and do not have the knowledge or experience in installing virtual and clustered environments.

Read *vSphere Basics* documentation for introduction to virtualization, ESXi, vCenter Server, virtual machines, clusters, vSphere vMotion, and vSphere HA.
Updated Information

This *vSphere Storage Appliance Installation and Configuration* is updated with each release of the product or when necessary.

This table provides the update history of *vSphere Storage Appliance Installation and Configuration*.

| 000397-00 | Initial release. |
VMware vSphere® Storage Appliance (VSA) is a VMware virtual appliance that packages SUSE Linux Enterprise Server 11 and storage clustering services. A VSA virtual machine runs on several ESXi hosts to abstract the storage resources that are installed on the hosts and to create a vSphere Storage Appliance cluster (VSA cluster).

This chapter includes the following topics:

- “What Is a VSA Cluster?,” on page 9
- “VSA Cluster Components,” on page 10
- “VSA Cluster Architecture,” on page 11
- “VSA Cluster Network Architecture,” on page 12
- “How a VSA Cluster Handles Failures,” on page 14
- “Differences Between VSA Clusters and Storage Area Networks,” on page 15
- “VSA Cluster Capacity,” on page 16

What Is a VSA Cluster?

A VSA cluster leverages the computing and storage resources of several ESXi hosts and provides a set of datastores that are accessible by all hosts within the datacenter.

An ESXi host that runs a vSphere Storage Appliance and participates in a VSA cluster is a VSA cluster member. With vSphere Storage Appliance 1.0, you can create a VSA cluster with two or three VSA cluster members. The status of the VSA cluster is online only when more than half of the members are online.

A VSA cluster enables the following features:

- Shared datastores for all hosts in the datacenter
- Replica of each shared datastore
- vSphere vMotion and vSphere HA
- Hardware and software failover capabilities
- Replacement of a failed VSA cluster member
- Recovery of an existing VSA cluster
VSA Cluster Components

vSphere components together with the required hardware setup and configuration form a VSA cluster. A VSA cluster requires the following vSphere and vSphere Storage Appliance components:

**ESXi 5.0 Hosts**
Two or three hosts with new installation of ESXi 5.0 can join a VSA cluster.

**vCenter Server 5.0**
A physical or virtual machine that runs vCenter Server 5.0 and manages all ESXi hosts that participate in the VSA cluster. If the machine is a virtual machine, it must not run on an ESXi host within the VSA cluster.

**vSphere Client 5.0**
An interface that enables users to connect remotely to vCenter Server or ESXi from any Windows computer and to manage the VSA cluster from the VSA Manager tab.

**vSphere Storage Appliance**
A VMware virtual appliance that runs SUSE Linux Enterprise Server 11 SP1 and a set of storage clustering services that perform the following tasks:

- Manage the storage capacity, performance, and data redundancy for the hard disks that are installed on the ESXi hosts
- Expose the disks of a host over the network
- Manage hardware and software failures within the VSA cluster
- Manage the communication between all instances of vSphere Storage Appliance, and between each vSphere Storage Appliance and the VSA Manager

Only one vSphere Storage Appliance can run on an ESXi host at a time.

**VSA Manager**
A vCenter Server 5.0 extension that you install on a vCenter Server machine. After you install it, you can see the VSA Manager tab in the vSphere Client. You can use VSA Manager to perform the following tasks:

- Deploy two or three vSphere Storage Appliance instances on two or three ESXi hosts to create a VSA cluster
- Mount as datastores the volumes that each vSphere Storage Appliance exports
- Monitor, maintain, and troubleshoot a VSA cluster

**VSA Cluster Member**
An ESXi host that runs a vSphere Storage Appliance. It is a functional member of a VSA cluster that exposes a datastore and maintains a datastore replica.

**VSA Cluster Service**
A Windows service that is installed with VSA Manager on the vCenter Server computer. The service is installed by default for all configurations, but is used in a VSA cluster with two members to act as a third member in case one of the VSA cluster members fails. In such a case, the Online status of two out of three members maintains the Online status of the cluster. The service does not provide storage volumes for the VSA datastores.

**IMPORTANT** VSA datastores continue operating with I/O, even if the VSA cluster service stops working. However, simultaneous failure of one of the VSA cluster members and of the VSA cluster service results in failure of the VSA datastores, and the status of the cluster changes to Offline.
VSA Cluster Leader

A vSphere Storage Appliance that reports the status of the cluster to the VSA Manager. All members of the cluster participate in an election process through which they select the leader. The leader uses the cluster IP address to communicate with the VSA Manager.

Gigabit Ethernet Switches

Gigabit Ethernet switches provide the high-speed network backbone of the VSA cluster.

VSA Cluster Architecture

The architecture of a VSA cluster includes the physical servers that have local hard disks, ESXi as the operating system of the physical servers, and the vSphere Storage Appliance virtual machines that run clustering services to create volumes that are exported as the VSA datastores.

vSphere Storage Appliance supports the creation of a VSA cluster with two or three members. A vSphere Storage Appliance uses the hard disks of an ESXi host to create two volumes of the same size. It exports one of the volumes as a datastore. The other volume is a replica of the volume that is exported by another vSphere Storage Appliance from another host in the VSA cluster.

Figure 1-1. VSA Cluster with 2 ESXi Hosts

In a VSA cluster with two VSA cluster members, an additional service called VSA cluster service runs on the vCenter Server machine. The service participates as a member in the VSA cluster, but it does not provide storage. To remain online, a VSA cluster requires that more than half of the members are also online. If one instance of a vSphere Storage Appliance fails, the cluster can remain online only if the remaining VSA cluster member and the VSA cluster service are online.

A VSA cluster with 2 members has 2 VSA datastores and maintains a replica of each datastore.

A VSA cluster with 3 members has 3 VSA datastores and maintains a replica of each datastore. This configuration does not require the VSA cluster service running on the vCenter Server system.
VSA Cluster Network Architecture

The physical network of a VSA cluster consists of Gigabit Ethernet switches and network interface cards (NICs) that are installed on each host.

Physical Network Architecture

All hosts in the VSA cluster must have two dual-port or four single-port network interface cards. You can use a single Gigabit Ethernet switch for the VSA cluster network. To ensure network redundancy, you should use two Gigabit Ethernet switches.

The following illustrations depict network redundancy in a VSA cluster with 2 and 3 members.
In a VSA cluster, the network traffic is divided into front-end and back-end traffic.

- Front-end network traffic
  - Communication between each VSA cluster member and the VSA Manager
  - Communication between ESXi and the VSA volumes
  - Communication between each VSA member cluster and the VSA cluster service
  - vMotion traffic between the hosts

- Back-end network traffic
  - Replication between a volume and its replica that resides on another host
  - Clustering communication between all VSA cluster members

**Logical Network Architecture**

Each vSphere Storage Appliance has two virtual NICs: one handles the front-end traffic, and the other handles back-end traffic. The back-end virtual NIC has an IP address from a private subnet. The front-end virtual NIC can have up to 3 assigned IP addresses.

- IP address for VSA management network
- IP address of the exported NFS volume
- IP address of the VSA cluster (assigned only when the VSA cluster member is elected as the cluster leader)

The IP address of the VSA cluster can move between VSA cluster members. It is assigned to the front-end virtual NIC of a VSA cluster member only when that VSA cluster member is elected as the cluster leader. If the cluster leader becomes unavailable, the VSA cluster IP address is assigned to another VSA cluster member that becomes the leader.

The VSA cluster installation creates two vSphere standard switches on each ESXi host to isolate front-end and back-end traffic. The physical NICs act as an uplink for each vSphere standard switch so that each NIC handles either front-end or back-end traffic. The standard switches use ESXi NIC teaming to provide link failover.

The following illustration depicts the logical network of a VSA cluster member that is the leader in the VSA cluster. The logical network of other VSA cluster members is the same with the exception of the assigned VSA cluster IP address.
How a VSA Cluster Handles Failures

A VSA cluster provides automatic failover from hardware and software failures.

Each VSA datastore has two volumes. A VSA cluster member exports the main volume as the VSA datastore. Another VSA cluster member maintains the second volume as a replica. If a failure occurs to the hardware, network equipment, or the VSA cluster member of the main volume, the main volume becomes unavailable, and the replica volume takes its place without service interruption. After you fix the failure and bring the failed VSA cluster member back online, the member synchronizes the main volume with the replica to provide failover in case of further failures.

A VSA cluster provides automatic failover from the following failures:

- Single physical NIC failure
- Single physical switch failure
- Single physical host failure
- Single VSA cluster member failure

The following illustration depicts automatic failover in a VSA cluster with 2 members. The replica volume takes over the failed main volume. In this case, to make sure that more than half of the members are online, the VSA cluster service simulates a VSA cluster member.
Differences Between VSA Clusters and Storage Area Networks

A VSA cluster is a virtual alternative to expensive SAN systems. While SAN systems provide centralized arrays of storage over a high-speed network, a VSA cluster provides a distributed array that runs across several physical servers and utilizes local storage that is attached to each ESXi host.

Centralized or Distributed Storage

SAN systems provide centralized arrays of storage that are managed by several storage processors. The vSphere Storage Appliance provides a distributed approach to storage, where the storage array is dispersed over several ESXi hosts and is accessible over the network.
Local Storage or Networked Storage

Servers can access storage through local hard disks or through hard disks that are attached to NAS or SAN systems. A VSA cluster utilizes the hard disks that are local to each ESXi host.

- **Local storage**: Local storage consists of internal hard disks located inside your ESXi host.
- **Networked storage**: Networked storage consists of external storage systems that your ESXi host uses to store virtual machine files remotely. Typically, the host accesses these systems over a high-speed storage network.

VSA Cluster Capacity

The total capacity of a VSA cluster is the sum of the capacities of all VSA datastores. Depending on the RAID configuration of your VSA cluster, you use different algorithms to calculate VSA capacity.

The VSA datastore capacity is calculated after ESXi installation takes hard disk space for root, swap, and dump partitions and after VSA installation reserves 20GB or more for local virtual machine swap files. Because of this, calculations of the VSA cluster capacity are approximate.

Calculating Capacity of a VSA Cluster with RAID10 Configuration

This topic explains how to calculate the capacity of a VSA cluster with 4, 6, or 8 hard disks per ESXi host and a RAID10 configuration.

The capacity of the VSA cluster that uses this configuration depends on two variables.

- Total hard disk capacity per ESXi host
- Number of ESXi hosts in the VSA cluster (2 or 3)

The capacity of a VSA datastore equals the total hard disk capacity of the ESXi host divided by 4. This is due to the RAID10 configuration on each ESXi host and the mirroring of VSA volumes between VSA cluster members.
Determine the VSA datastore capacity by using the following formula.  
VSA datastore capacity = hard disk capacity of an ESXi host / 4

Where
hard disk capacity of an ESXi host = the total capacity of the hard disks that are installed internally on the ESXi host

If you create a VSA cluster with hosts that have different total hard disk capacities, the lowest hard disk capacity from all ESXi hosts becomes the basis for calculating the capacity of every VSA datastore. In such a situation, some of the total hard disk capacity remains unused.

**Example: Calculating the VSA Cluster Capacity in a Cluster with 3 ESXi Hosts with 8TB Hard Disk Capacity Per Host**

Hard disk capacity per ESXi host = 8TB  
Total hard disk capacity of all ESXi hosts = 24TB  
VSA datastore capacity = 8TB / 4 = 2TB  
Total VSA cluster capacity = 2TB * 3 hosts = 6TB

**Example: Calculating the VSA Cluster Capacity in a Cluster with 3 ESXi Hosts with Different Capacities**

Hard disk capacity of ESXi host 1 = 6TB  
Hard disk capacity of ESXi host 2 = 8TB  
Hard disk capacity of ESXi host 3 = 8TB  
Total hard disk capacity = 22TB  
VSA datastore capacity = 6TB / 4 = 1.5TB

**Note**  The lowest hard disk capacity of all ESXi hosts becomes the basis for determining the capacity of all VSA datastore.  
Total VSA cluster capacity = 1.5TB * 3 hosts = 4.5TB  
In this example, the VSA cluster capacity is only 4.5TB

**Note**  Because this scenario underutilizes the hard disk space of the ESXi hosts that have more capacity, you should ensure that all ESXi hosts have the same hard disk capacity.

**Calculate Capacity of a VSA Cluster with RAID5 and RAID6**

This task explains how to calculate the capacity of a VSA cluster that uses hardware RAID5 or RAID6 configuration.

In this configuration, the capacity of the VSA cluster depends on the following variables:

- Number of hard disks in the hardware RAID set. The number of disks you can have in the RAID5 configuration is 4 to 8. In RAID6, the number of disks is 5 to 8. VMware recommends that you use RAID5 for SAS drives and RAID6 for SATA drives.
- Capacity of a hard disk in the hardware RAID set. For simplicity, assume that all hard disks are of equal capacity.
- Number of ESXi hosts in the VSA cluster (2 or 3).
Procedure

1. Calculate the storage capacity available on each ESXi host. The formula you use depends on your RAID configuration.
   - For RAID5, use the following formula. The number of disks you can have in the RAID5 configuration is 4 to 8.
     \[
     \text{total storage capacity per host} = (\text{number of hard disks in the RAID} - 1) \times \text{hard disk capacity}
     \]
   - For RAID6, use the following formula. The number of disks you can have in the RAID6 configuration is 5 to 8.
     \[
     \text{total storage capacity per host} = (\text{number of hard disks in the RAID} - 2) \times \text{hard disk capacity}
     \]
   **NOTE** If your hosts have different total storage capacities, the lowest value among all VSA cluster hosts becomes the basis for calculating the capacity of every VSA datastore. Some of the total storage capacity remains unused in this case.

2. Calculate the capacity of a RAID5 or RAID6 VSA datastore by using the following formula:
   \[
   \text{capacity of a VSA datastore} = \frac{\text{total storage capacity per host}}{2}
   \]
   The value that you get is a combination of the storage efficiency of the hardware RAID5 or RAID6 configuration on each of the ESXi hosts and the mirroring of VSA volumes between VSA cluster members.

3. Calculate total capacity of a VSA cluster by using the following formula:
   \[
   \text{total VSA cluster capacity} = \text{capacity of a VSA datastore} \times \text{number of hosts in the VSA cluster}
   \]

Example: Calculating Capacity of a VSA Cluster with RAID5 or RAID 6 Configuration

For the RAID5 example, the following parameters are used:
- Number of hard disks in the hardware RAID5 set: 8
- Capacity of each hard disk: 500GB
- Number of ESXi hosts in the VSA cluster: 3
  \[
  \text{total storage capacity per host} = (8-1) \times 500\text{GB} = 3.5\text{TB}
  \]
  \[
  \text{capacity of a VSA datastore} = \frac{3.5\text{TB}}{2} = 1.75\text{TB}
  \]
  \[
  \text{total VSA cluster capacity} = 1.75\text{TB} \times 3 \text{ hosts} = 5.25\text{TB}
  \]

For the RAID6 example, the following parameters are used:
- Number of hard disks in the hardware RAID5 set: 8
- Capacity of each hard disk: 1TB
- Number of ESXi hosts in the VSA cluster: 3
  \[
  \text{total storage capacity per host} = (8-2) \times 1\text{TB} = 6\text{TB}
  \]
  \[
  \text{capacity of a VSA datastore} = \frac{6\text{TB}}{2} = 3\text{TB}
  \]
  \[
  \text{total VSA cluster capacity} = 3\text{TB} \times 3 \text{ hosts} = 9\text{TB}
  \]
VSA Cluster Disk Capacity

The RAID level you select for each ESXi host participating in a VSA cluster determines the number of disks per host and the maximum per disk capacity.

Install and Configure the VSA Cluster Environment

Before you can create a VSA cluster, you must prepare your environment by installing and configuring the hardware and software components.

This chapter includes the following topics:
- “vSphere Storage Appliance Planning Checklist,” on page 21
- “VSA Cluster Requirements,” on page 22
- “Configure RAID on a Dell Server,” on page 27
- “Configure RAID on an HP Server,” on page 27
- “Configure VLAN IDs on the Ethernet Switches,” on page 28
- “ESXi Installation,” on page 28
- “Configure the ESXi Hosts,” on page 30
- “vCenter Server Installation,” on page 33
- “Install the vSphere Client,” on page 35
- “Create a Datacenter and Add Hosts to It,” on page 35
- “VSA Manager System and Software Requirements,” on page 36
- “Install VSA Manager,” on page 38
- “Uninstall VSA Manager,” on page 39

**vSphere Storage Appliance Planning Checklist**

You should decide on the scale and capacity of the VSA cluster and also consider some setup limitations.

- Install vCenter Server on a physical host or as a virtual machine on an ESXi host that does not participate in a VSA cluster.
- ESXi hosts cannot run virtual machines before creating the cluster.
- vCenter Server must be installed and running before you create the VSA cluster.
- If you run vCenter Server on a VSA datastore and the datastore goes offline, you might not be able to manage the VSA cluster due to the loss of access to vCenter Server and VSA Manager.
- Decide on 2- or 3-member VSA cluster. You cannot add another VSA cluster member to a running VSA cluster. For example, you cannot extend a 2-member VSA cluster with another member.
Determine the capacity of the VSA cluster before installation.

vSphere Storage Appliance 1.0 does not support addition of storage to the VSA datastores and their replicas after the VSA cluster is installed.

The VSA cluster requires RAID volumes created from the physical disks. VMware recommends that you use RAID5, RAID6, or RAID10. The vSphere Storage Appliance uses RAID1 to maintain the VSA datastores' replicas. The capacity of the VSA datastores depends on the number of physical hard disks and the RAID configuration that you use. The actual realized capacities are calculated separately for RAID5, RAID6 and RAID10. For information, see “VSA Cluster Capacity,” on page 16.

Determine the number of virtual machines that will run in the VSA cluster.

Consider the vSphere HA admission control reservations when determining the number of virtual machines and the amount of resources that your cluster supports. vSphere HA admission control reserves 33% of all CPU and memory resources in a 3-member VSA cluster and 50% of all CPU and memory resources in a 2-member cluster. vSphere HA admission control makes the reservations to ensure that resources are available when virtual machines need to be restarted from a failed ESXi host onto a running ESXi host.

VSA datastores do not support VMX swapping. Because of this, you should reserve the configured memory of all non-VSA virtual machines that use VSA datastores so that you do not overcommit memory. For virtual machines that are not stored on the VSA datastores, you can skip this step. For more information about preventing memory overcommitment, see the VMware vSphere Storage Appliance Administration document.

VSA Cluster Requirements

Make sure that your environment meets the hardware and configuration requirements to create a VSA cluster.

Ensure that you have the hardware resources needed to install a VSA cluster.

- Physical or virtual machine on which to install vCenter Server. If you install vCenter Server on a virtual machine, the virtual machine must run on an ESXi host that participates in the VSA cluster.
- Two or three physical servers on which to install ESXi
- At least one Gigabit Ethernet switch

Hardware Requirements for vCenter Server in a VSA Cluster

Make sure that your run vCenter Server on a machine that meets the requirements for the VSA cluster.

You can install vCenter Server on a physical server or on a virtual machine. Make sure that the machine that you choose meets the vCenter Server hardware requirements to operate in a VSA cluster. If you choose to run vCenter Server on a virtual machine, that virtual machine cannot be hosted on an ESXi host that is running a vSphere Storage Appliance.

Network Switch Requirements for a VSA Cluster

The VSA cluster network must have at least 1 dedicated Gigabit Ethernet switch that supports IEEE 802.1Q VLAN trunking.

You can have 2 dedicated switches to eliminate a single point of failure in the physical network. The switches must be configured to support the IP ranges of the front-end and back-end networks of the VSA cluster. To isolate front-end and back-end networks, you should use VLANs instead of physical isolation. VLAN isolation protects the VSA virtual NICs from Ethernet broadcast storms and malicious capturing and parsing of Ethernet frames.

You can configure two VLAN IDs on your switches to isolate traffic between the front-end and back-end networks. You can use the VLAN IDs in the VSA Installer and VSA Automated Installer to specify the VLAN IDs for the front-end and back-end networks. Using VLAN IDs is not mandatory.

**NOTE** VLAN IDs can range from 1 to 4094. You cannot use 0 and 4095.

Table 2-5. VLAN ID Configuration for a VSA Cluster

IP Address Requirements for a VSA Cluster

The VSA cluster network requires a number of static IP addresses in the subnet of the vCenter Server IP address. Depending on the number of hosts in the cluster and whether you choose to use DHCP for the vSphere feature network, the number of required static IP addresses varies.

The following table shows examples and the total number of static IP address that you need in the vCenter Server subnet for various VSA cluster configurations.

<table>
<thead>

Configure RAID on a Dell Server

For Dell servers, you use the Dell PowerEdge RAID Controller (PERC) to create a RAID volume that uses all physical disks on a server.

**Note** VMware recommends that you use RAID5 for SAS drives and RAID6 for SATA drives.

**Procedure**
1. Start or restart the Dell PowerEdge server.
2. Press Ctrl+R to access the Perc 6/I Integrated BIOS Configuration Utility.
   - The configuration utility opens and shows the **VD Mgmt** tab.
3. To create a new virtual disk, press F2 and select **Create New VD**.
4. Select an appropriate RAID configuration from the **RAID Level** drop-down menu.
   - VMware recommends that you use RAID 5, 6, or 10.
5. Under Physical Disks, select the hard disks that you want to include in the virtual disk.
6. Select **OK** and press Enter.
   - The virtual disk is created.
7. Expand the Disk Group option, and under Virtual Disks, select the newly created virtual disk and press F2 to open the Operations menu.
8. From the Operations menu, select **Initialization > Start Init.** to initialize the new virtual disk.

The new RAID volume is ready for use.

Configure RAID on an HP Server

Create a RAID logical volume that uses all physical disks on a server.

**Note** VMware recommends that you use RAID5 for SAS drives and RAID6 for SATA drives.

**Procedure**
1. Start or restart the HP server.
2. At boot time, press F8 to enter the Integrated Lights-Out 2 setup.
3. Provide credentials at the login prompt.
4  Press Ctrl+S to open the Intel Boot Agent Setup Menu.
5  Press F8 to open the ROM Array Configuration menu.

   The Main Menu appears.
6  From the Main Menu, select Create Logical Drive and press Enter.
7  Select all physical disks under Available Physical Drives.
8  Select an appropriate RAID level under RAID Configurations.

   VMware recommends that you use RAID 5, 6, or 10.
9  Press Esc.

   The HP RAID controller creates the RAID logical drive.

**Configure VLAN IDs on the Ethernet Switches**

To make use of traffic isolation, you should configure separate VLAN IDs for the front end and back end networks of the VSA cluster.

**Procedure**

1  Read the documentation for your Gigabit Ethernet switch for information about how to configure VLAN IDs.
2  Work with your network administrator to assign VLAN IDs for the front end and back end networks.

   A VLAN ID should range from 1 to 4094, as 0 and 4095 are not allowed.

   The assigned VLAN IDs are ready to be assigned to the ESXi hosts and to the VSA cluster network.

**ESXi Installation**

Install ESXi 5.0 on each host that you plan to include in a VSA cluster.

**Required Information for ESXi Installation**

In an interactive installation, the system prompts you for the required system information. In a scripted installation, you must supply this information in the installation script.

For future use, note the values you use during the installation. These notes are useful if you must reinstall ESXi and reenter the values that you originally chose.

Install ESXi Interactively

You use the ESXi CD/DVD or a USB flash drive to install the ESXi software onto a SAS, SATA, SCSI hard drive, or USB drive.

ESXi Embedded must not be on the host. ESXi Installable and ESXi Embedded cannot exist on the same host.

Prerequisites

- You must have the ESXi ISO file on CD or DVD. If you do not have the installation CD/DVD, you can create one.
- Verify that the server hardware clock is set to UTC. This setting is in the system BIOS.
- Verify that a keyboard and monitor are attached to the machine on which the ESXi software will be installed.
- Consider disconnecting your network storage. This action decreases the time it takes the installer to search for available disk drives. Note that when you disconnect network storage, any files on the disconnected disks are unavailable at installation.
- Do not disconnect a LUN that contains an existing ESX or ESXi installation. Do not disconnect a VMFS datastore that contains the Service Console of an existing ESX installation. These actions can affect the outcome of the installation.
- Gather the information required by the ESXi installation wizard. See “Required Information for ESXi Installation,” on page 28.

Procedure

1. Insert the ESXi CD/DVD into the CD/DVD-ROM drive and restart the machine.
2. Set the BIOS to boot from the CD-ROM device.
   
   See your hardware vendor documentation for information on changing boot order.
3. On the Select a Disk page, select the drive on which to install ESXi and press Enter.
   
   Press F1 for information about the selected disk.

   **Note**: Do not rely on the disk order in the list to select a disk. The disk order is determined by the BIOS and might be out of order. This might occur on systems where drives are continuously being added and removed.

   If the disk you selected contains data, the Confirm Disk Selection page appears.
4. Select the keyboard type for the host.
   
   You can change the keyboard type after installation in the direct console.
5 Enter the root password for the host. 
   You can leave the password blank, but to secure the system from the first boot, enter a password. You can 
   change the password after installation in the direct console.

6 Press F11 to start the installation.

7 When the installation is complete, remove the installation CD or DVD.

8 Press Enter to reboot the host.
   If you are performing a new installation, or you chose to overwrite an existing VMFS datastore, during 
   the reboot operation, VFAT scratch and VMFS partitions are created on the host disk.

9 Set the first boot device to be the drive on which you installed ESXi in Step 3.
   For information about changing boot order, see your hardware vendor documentation.

What to do next
Set up basic administration and network configuration for ESXi.

Configure the ESXi Hosts
You must configure the ESXi hosts before they can join the VSA cluster.

Log In to an ESXi Host
Log in to an ESXi host to configure it.

Procedure
1 Connect to the management interface of your ESXi host and run the remote console.
2 In the remote console window, press F2 and log in with root credentials.
   If you are logging in for the first time, the root password is empty.

The System Customization menu opens.

What to do next
Change the root password for the ESXi host.

Change the root Password of an ESXi Host
The root password is empty when you log in for the first time. To improve the security of your ESXi host, 
change the default password after you log in for the first time.

Procedure
1 In the System Customization menu of the ESXi host, use the keyboard arrows to select Configure 
   Password and press Enter.
   The Configure Password dialog box appears.
2 Fill the required fields to change the password and press Enter.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Old Password</td>
<td>Type the old password of the ESXi host.</td>
</tr>
<tr>
<td>New Password</td>
<td>Type the new password for the ESXi host.</td>
</tr>
<tr>
<td>Confirm Password</td>
<td>Confirm the new password.</td>
</tr>
</tbody>
</table>
The root password for the ESXi host is changed.

**What to do next**

Configure the network settings of the ESXi host.

---

**Assign a Static IP Address to an ESXi Host**

Each ESXi host in the VSA cluster must have a unique static IP address that is in the same subnet as the vCenter Server IP address.

**Prerequisites**

Work with your network administrator to allocate the static IP addresses that are required by the VSA cluster.

**Procedure**

1. In the System Customization menu, select **Configure Management Network** and press Enter.
2. In the Configure Management Network menu, select **IP Configuration** and press Enter.
3. In the IP Configuration dialog box, select **Set static IP address and network configuration** and press the spacebar.
4. Type the static IP configuration in the corresponding text boxes and press Enter.
   
<table>
<thead>
<tr>
<th>Network Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>Enter a static IP address for the ESXi host.</td>
</tr>
<tr>
<td>Subnet Mask</td>
<td>Enter the subnet mask of the network to which the static IP address belongs.</td>
</tr>
<tr>
<td>Default Gateway</td>
<td>Enter the gateway for the subnet.</td>
</tr>
</tbody>
</table>

5. Press Esc.
   
The Configure Management Network confirmation dialog box appears.
6. Press Y to restart the management network and apply the new static IP address.
   
ESXi configures the management network with the static IP address that you assigned.

---

**Assign a VLAN ID to an ESXi Host**

To isolate the management traffic of the ESXi hosts within the VSA cluster network, assign the same VLAN ID to each ESXi host that you want to add to the VSA cluster.

**Prerequisites**

Configure your Ethernet switches with the VLAN IDs that your ESXi hosts should use.

**Procedure**

1. In the System Customization menu, select **Configure Management Network** by using the keyboard arrows and press Enter.
2. In the Configure Management Network menu, select **VLAN (option)** and press Enter.
3. In the **VLAN ID** input text box, type the VLAN ID of the virtual LAN that your ESXi should use, and press Enter.
   
The VLAN ID for the ESXi host is set.
What to do next
Configure DNS on each ESXi host.

Specify a Hostname and DNS Servers for an ESXi Host
To enable DNS resolution on your ESXi hosts, add DNS servers to the ESXi network settings.

Procedure
1. In the Configure Management Network menu, select DNS Configuration and press Enter.
2. In the DNS Configuration dialog box, use the keyboard arrows to select Use the following DNS server addresses and hostname and press the spacebar.
3. Fill the required input fields to configure the DNS settings of the ESXi host and press Enter.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary DNS Server</td>
<td>Type the IP address of the primary DNS server of the ESXi host network.</td>
</tr>
<tr>
<td>Alternate DNS Server</td>
<td>Type the IP address of the secondary DNS server of the ESXi host network.</td>
</tr>
<tr>
<td>Hostname</td>
<td>Type the hostname of the ESXi host.</td>
</tr>
</tbody>
</table>

What to do next
You can test the network configuration of the ESXi host.

Test the Management Network of an ESXi Host
After you configure the ESXi host network settings, you can test the management network of the host to verify that it is working correctly.

Prerequisites
Configure the ESXi host IP address, VLAN ID, and DNS servers.

Procedure
1. In the System Customization menu, select Test Management Network and press Enter.
   The Test Management Network dialog box appears. The dialog box contains the gateway IP address of the subnet and the DNS servers that you specified.
2. To test if the ESXi host management network, press Enter.
   ESXi performs the following tests:
   - pings the subnet gateway specified
   - pings the primary DNS server specified
   - pings the alternate DNS server specified
   - resolves the hostname of the ESXi host
3. If any of the tests fail, verify that you specified the correct settings in the respective configuration menu and rerun the tests.

What to do next
Press Esc to log out of the ESXi system customization and close the remote console. You can now connect the configured ESXi hosts to a vCenter Server.
vCenter Server Installation

You install vCenter Server to manage the ESXi hosts and to install and monitor a VSA cluster.

Before you install vCenter Server, make sure your system meets the minimum hardware and software requirements. vCenter Server requires a database. vCenter Server uses Microsoft SQL Server 2008 R2 Express for small deployments with up to 5 hosts and 50 virtual machines. For larger deployments, VMware supports several Oracle and Microsoft SQL Server databases. Refer to the vSphere Compatibility Matrixes for the list of supported databases.

vCenter Server Prerequisites

Before installing vCenter Server, review the prerequisites.

- Verify that you have a separate 64-bit physical server on which to install vCenter Server 5.0. You can also install ESXi 5.0 on that system and deploy vCenter Server in a virtual machine within the host. vCenter Server 5.0 cannot run as a virtual machine on an ESXi host that runs a vSphere Storage Appliance.
- Verify that the physical server or virtual machine meets the hardware requirements for vCenter Server. For more information about the vCenter Server requirements, see “Hardware Requirements for vCenter Server in a VSA Cluster,” on page 22.
- Verify that you have vSphere Storage Appliance 1.0 installation DVD, or download the vCenter Server 5.0 installer from the VMware product page http://www.vmware.com/products/.
- Verify that the fully qualified domain name (FQDN) of the system where you will install vCenter Server is resolvable. To check that the FQDN is resolvable, type `nslookup your_vCenter_Server_fqdn` at a command line prompt. If the FQDN is resolvable, the `nslookup` command returns the IP and name of the domain controller machine.
- Verify that the host name of the machine that you are installing vCenter Server on complies with RFC 952 guidelines.
- Verify that DNS reverse lookup returns a fully qualified domain name when queried with the IP address of the vCenter Server. When you install vCenter Server, the installation of the web server component that supports the vSphere Client fails if the installer cannot look up the fully qualified domain name of the vCenter Server from its IP address. Reverse lookup is implemented using PTR records. To create a PTR record, see the documentation for your vCenter Server host operating system.
- Verify that no Network Address Translation (NAT) exists between the vCenter Server system and the hosts it will manage.
- For small-scale deployments, VMware recommends installing the bundled SQL Server 2008 R2 Express database on one of the supported operating systems.
- If the system that you use for your vCenter Server installation belongs to a workgroup rather than a domain, not all functionality is available to vCenter Server. If assigned to a workgroup, the vCenter Server system is not able to discover all domains and systems available on the network when using some features. To determine whether the system belongs to a workgroup or a domain, right-click My Computer. Click Properties and click the Computer Name tab. The Computer Name tab displays either a Workgroup label or a Domain label.
- During the installation, verify that the connection between the machine and the domain controller is working.
- Verify that the computer name is no more than 15 characters.
- The NETWORK SERVICE account is required on the folder in which vCenter Server is installed and on the HKLM registry.
- Verify that the DNS name of the machine matches the actual computer name.
Make sure the system on which you are installing vCenter Server is not an Active Directory domain controller.

On each system that is running vCenter Server, make sure that the domain user account has the following permissions:

- **Member of the Administrators group**
- **Act as part of the operating system**
- **Log on as a service**

Install vCenter Server, like any other network server, on a machine with a fixed IP address and well-known DNS name, so that clients can reliably access the service. Assign a static IP address and host name to the Windows server that will host the vCenter Server system. This IP address must have a valid (internal) domain name system (DNS) registration. Ensure that the ESXi host management interface has a valid DNS resolution from the vCenter Server and all vSphere Clients. Ensure that the vCenter Server has a valid DNS resolution from all ESXi hosts and all vSphere Clients. If you use DHCP instead of a static IP address for vCenter Server, make sure that the vCenter Server computer name is updated in the domain name service (DNS). Ping the computer name to test this connection. For example, if the computer name is `host-1.company.com`, run the following command in the Windows command prompt:

```
ping host-1.company.com
```

If you can ping the computer name, the name is updated in DNS.

### Install vCenter Server

vCenter Server allows you to centrally manage hosts from either a physical or virtual Windows machine, and enables the management of a VSA cluster as well as the use of advanced features such as vSphere High Availability (HA), vSphere vMotion, and vSphere Storage vMotion.

A vCenter Server instance can manage only one instance of a VSA cluster.

### Prerequisites

See “vCenter Server Prerequisites,” on page 33.

vCenter Server requires the Microsoft .NET 3.5 SP1 Framework. If your system does not have it installed, the vCenter Server installer installs it. The .NET 3.5 SP1 installation might require Internet connectivity to download more files.

### Procedure

1. In the software installer directory, double-click the `autorun.exe` file to start the installer.
2. Select **vCenter Server™**.
3. Follow the prompts in the installation wizard to choose the installer language, agree to the end user patent and license agreements, enter your user name, organization name, and license key.
   
   If you omit the license key, vCenter Server will be in evaluation mode, which allows you to use the full feature set for a 60-day evaluation period. After installation, you can enter the license key to convert vCenter Server to licensed mode.
4. Click **Install SQL Server 2008 Express instance (for small-scale deployments)**.
   
   This database is suitable for small deployments of up to 5 hosts and 50 virtual machines.
5. Select **Use SYSTEM Account** and click **Next**.

   The Fully Qualified Domain Name field displays the FQDN of the system that you are installing vCenter Server on. The vCenter Server installer checks that the FQDN is resolvable. If not, a warning message is displayed when you click **Next**. Change the entry to a resolvable FQDN. You must enter the FQDN, not the IP address.
6 Accept the default destination folders and click **Next**.

7 Select **Create a standalone VMware vCenter Server instance** and click **Next**.

8 For each component that you install, accept the default port numbers and click **Next**.

---

**CAUTION** Do not change the default vCenter Server ports, as it might lead to VSA upgrade failures.

9 Select the size of your vCenter Server inventory to allocate memory for several Java services that are used by vCenter Server.

This setting determines the maximum JVM heap settings for VMware VirtualCenter Management Webservices (Tomcat), Inventory Service, and Profile-Driven Storage Service. You can adjust this setting after installation if the number of hosts in your environment changes. See the recommendations in the *vCenter Server Hardware Requirements* topic in *System Requirements*.

10 Click **Install**.

   Installation might take several minutes. Multiple progress bars appear during the installation of the selected components.

11 Click **Finish**.

**What to do next**

After you complete the installation, use the vSphere Client to connect to vCenter Server.

---

**Install the vSphere Client**

The vSphere Client enables you to connect to an ESXi host and to a vCenter Server system.

**Prerequisites**

- In a Web browser application, enter the IP address of a vCenter Server or an ESXi host, and click **Download** **vSphere Client**.
- Verify that you are a member of the Administrators group on the system.
- Verify that the system has an Internet connection.

**Procedure**

1 Double-click the *VMware-viclient*<build number>*.exe* file to run the vSphere Client installer.

2 Follow the prompts in the wizard to complete the installation.

**What to do next**

Use the vSphere Client to connect to vCenter Server.

---

**Create a Datacenter and Add Hosts to It**

Before you create a VSA cluster, you must create a datacenter and add newly installed ESXi hosts in vCenter Server.

You can create a VSA cluster with two or three ESXi hosts. The number of available datastores in the VSA cluster equals the number of hosts that you add to it. Creating a cluster with three hosts makes the cluster more reliable and provides more datastore space.

You can skip this procedure, if you use the VSA Automated Installer.
Procedure

1 Log in to vCenter Server.
   a Start vSphere Client.
   b In the VMware vSphere Client dialog box, type the IP address or host name of your vCenter Server machine in the **IP address / Name** text box.
   c Specify administrator credentials for vCenter Server in the **User name** and **Password** text boxes.
   d Click **Login**.

2 Create a new datacenter.
   a In vSphere Client, select **File > New > Datacenter**.
      A new datacenter object appears in the inventory.
   b Enter a name for the datacenter and press Enter.

3 Add hosts to the new datacenter.
   a Select the datacenter in the inventory.
   b Select **File > New > Add Host**.
   c On the Connection Settings page of the Add Host Wizard, enter the IP address and root credentials of the ESXi host to add and click **Next**.
   d On the Host Summary page, review the information about the host and click **Next**.
   e On the Assign License page, select **Assign a new license key to this host** radio button if your ESXi host does not have an assigned license, and assign a new license.
   f Click **Next**.
   g On the Virtual Machine Location page, select the datacenter you created and click **Next**.
   h On the Ready to Complete page, review your selections and click **Finish**.
   i Repeat steps from a to h to add another ESXi host.

**What to do next**

You can now create the VSA cluster by running the VSA Installer wizard.

**VSA Manager System and Software Requirements**

Verify that the vCenter Server computer meets the hardware and software requirements to install VSA Manager.

**Hardware Requirements**

VSA Manager has the same hardware requirements as vCenter Server 5.0. For more information about the vCenter Server 5.0 hardware requirements, see vCenter Server and vSphere Client Hardware Requirements.

**Supported Operating Systems**

- Windows Server 2003 Standard, Enterprise, or Datacenter 64-bit (SP2 required)
- Windows Server 2003 R2 Standard, Enterprise, or Datacenter 64-bit (SP2 required)
- Windows Server 2008 Standard, Enterprise, or Datacenter 64-bit
- Windows Server 2008 Standard, Enterprise, or Datacenter 64-bit SP2
- Windows Server 2008 Standard, Enterprise, or Datacenter 64-bit R2
Software Requirements

You install VSA Manager on the vCenter Server system.

- vCenter Server 5.0
- vCenter Server 5.0 Java Runtime Environment 1.6 (installed during vCenter Server 5.0 installation)
- vCenter Server 5.0 Tomcat 6.0.18 (installed during vCenter Server 5.0 installation)
- Windows Installer 4.5 or higher
- Microsoft .NET Framework 3.5 SP1
- Internet Explorer 7 or higher
- Latest version of Adobe Flash for Internet Explorer

Hard Disk Space Requirements

Make sure that you have sufficient disk space to install VSA Manager.

Table 2-8. Hard Disk Space Requirements for VSA Manager Installation

<table>
<thead>
<tr>
<th>File or Directory Used by VSA Manager Installer</th>
<th>Hard Disk Space Requirements</th>
</tr>
</thead>
<tbody>

Windows Privileges Requirements

You must be a local Administrator to install and run the VSA Manager Installer.

Install VSA Manager

VSA Manager is a plug-in for vSphere Client that you use to create and manage a VSA cluster. VSA Manager also installs the VSA cluster service on the vCenter Server machine.

You can install VSA Manager only on a 64-bit Windows Server machine that runs vCenter Server 5.0.

Prerequisites

Download the VSA Manager Installer.

Procedure

3. Select I accept the terms in the license agreement and click Next.
   
   The vCenter Server Information page appears and VSA Manager installer automatically fills the vCenter Server IP address or host name, the Administrator user name, and the HTTPS port of the vCenter Server machine.
4. On the VMware vCenter Server Information page, verify that the vCenter Server IP address or host name is that of the local machine and click Next.

   CAUTION   Do not modify the vCenter Server ports because that might lead to upgrade failures.

5. On the License Information page, type a vCenter Server license key and click Next.

   The vCenter Server license key must include vSphere Storage Appliance as a feature. Otherwise, vSphere Storage Appliance runs in evaluation mode.
6. Click Install on the Ready to Install page.

   Wait for the wizard to complete the installation.
7. (Optional) To open the installation log, select the Show the Windows Installer log check box.
8. Click Finish.

VSA Manager plug-in is installed and registered with vCenter Server. The VSA cluster service is also installed, but is only used in a VSA cluster with two VSA cluster members. The next time you connect to the vCenter Server and select a datacenter from the vCenter Server inventory, the VSA Manager tab appears.

NOTE  The VSA Manager tab might take some time to appear. If it does not appear, select Plug-ins > Manage Plug-ins, right-click VSA Manager, and select Enable to enable the VSA Manager tab.
What to do next

If the VSA Manager tab contents do not load and require that Adobe Flash Player is installed, download and install Adobe Flash Player on the system, and restart the vSphere Client.

You can use the VSA Manager tab to create the VSA cluster by using the VSA Installer wizard.

Uninstall VSA Manager

You can uninstall VSA Manager if you have deleted the VSA cluster and no longer use the plug-in for maintenance and monitoring.

When you uninstall VSA Manager while the VSA cluster is still running, the VSA Manager plug-in and the VSA Manager tab are removed from vCenter Server and the VSA cluster service is stopped and deleted. As a result, you can no longer use VSA Manager to monitor or reconfigure the VSA cluster. Also, in a 2-member VSA cluster, the VSA cluster service can no longer provide an additional vote in the election of the VSA cluster leader. In this case, the VSA cluster status might become Offline, and the cluster becomes unavailable.

**IMPORTANT** To ensure that a running 2-member VSA cluster is available and its status is Online, do not uninstall VSA Manager. If you have a 3-member VSA cluster, the VSA cluster continues working without interruption even if you uninstall VSA Manager.

To delete the VSA cluster, you must use the `cleanup.bat` script that is part of the VSA Manager installation.

**Procedure**

1. Open the list of programs on the Windows Server system that runs VSA Manager and vCenter Server.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows Server 2003</td>
<td>In Control Panel, select Add or Remove Programs.</td>
</tr>
<tr>
<td>Windows Server 2008</td>
<td>In Control Panel, under the Programs section select Uninstall a Program.</td>
</tr>
</tbody>
</table>

2. From the list of programs, select VMware vSphere Storage Appliance Manager and click Uninstall.

3. Click Yes in the confirmation dialog box.

The VSA Manager plug-in and the VSA cluster service are uninstalled. The VSA Manager tab no longer appears when you select a datacenter object.
After you install and configure the components of the VSA cluster, you can create a VSA cluster with the VSA Installer or VSA Automated Installer.

This chapter includes the following topics:

- “Manual Creation of the VSA Cluster,” on page 41
- “Automated Creation of a VSA Cluster,” on page 45
- “Verify the VSA Datastores,” on page 47
- “Delete a VSA Cluster,” on page 48

**Manual Creation of the VSA Cluster**

If you already have vCenter Server 5.0 installed, you can use the VSA Installer wizard to create the VSA cluster manually.

The VSA Installer wizard provides a graphical workflow to installing the VSA cluster. You use the wizard to accomplish a set of tasks.

1. Select a datacenter object for the VSA cluster
2. Select which hosts to include in the VSA cluster
3. Configure the network of the VSA cluster
4. Choose when to format the disks of the VSA cluster

After you complete the steps in the wizard, the VSA Installer performs a set of tasks that create the VSA cluster.

1. Configures the network of each ESXi host.
   
The installer creates a front-end and a back-end virtual switch on each ESXi instance to support the front-end and back-end networks of the cluster. The installer selects two uplink ports for each virtual switch from the four available NIC ports. As a result, each virtual switch has one primary and one redundant uplink.

2. Deploys a vSphere Storage Appliance on each ESXi host.

3. Configures each vSphere Storage Appliance to export one half of the ESXi storage space as a VSA datastore, and the other half as a replica of another VSA datastore.
   
   - VSA 0 exports VSA datastore 0 and maintains a replica of VSA datastore 2.
   - VSA 1 exports VSA datastore 1 and maintains a replica of VSA datastore 0.
   - VSA 2 exports VSA datastore 2 and maintains a replica of VSA datastore 1.
4 Configures the network interfaces on each vSphere Storage Appliance to establish the front-end and back-end networks of the VSA cluster.

The VSA cluster members form the VSA cluster by establishing a process of electing a cluster leader. The cluster leader is the VSA cluster member that communicates with VSA Manager to report the status of the VSA cluster.

Create a VSA Cluster

You use the VSA Installer to deploy vSphere Storage Appliance and create a VSA cluster. A VSA cluster enables shared datastores that are connected to all hosts in the datacenter. The VSA Installer enables and configures vMotion and High Availability on the created VSA cluster.

Prerequisites

- Make sure that the latest version of Adobe Flash is installed on the vCenter Server system.
- Make sure that Internet Explorer 7 or higher is installed on the vCenter Server system.
- Assign a static IP address to the vCenter Server system.
- Ensure that you have the right number of static IP addresses available for your VSA cluster. For more information about IP address requirements, see “VSA Cluster Requirements,” on page 22.

Procedure

1 Start the VSA Installer wizard.
   a In vSphere Client, select a datacenter that has two or more ESXi hosts and select the VSA Manager tab.
      The VSA Installer wizard appears in the tab.
   b Click Next.
2 Review the vSphere features that the VSA cluster enables and click Next.
3 On the Datacenter page, select a datacenter for the VSA cluster and click Next.
4 On the Hosts page, select two or three ESXi hosts and click Next.
   The wizard categorizes the hosts by CPU family. In a VSA cluster, you can include only hosts that have CPUs from the same CPU family.
   If you select hosts from different CPU families or with different hardware configurations, the wizard informs you that the hosts cannot join the same VSA cluster.
5 On the Configure Network page, provide the IP addresses and configuration for the VSA cluster network, and click Next.

</table>

6 On the Format Disks page, select when to format the disks.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format disks on first access</td>
<td>Disks are formatted after installation on first read or write.</td>
</tr>
<tr>
<td>Format disks immediately</td>
<td>Disks are formatted during the installation with zeroes. This requires additional time during the installation process.</td>
</tr>
</tbody>
</table>

7 Review the VSA cluster configuration on the Ready to Install page and click **Install**.
   The Ready to Install page provides information about the ESXi hosts and the network configuration of each VSA cluster member.

8 In the Start Installation window, click **Yes** to confirm the creation of the VSA cluster.
   The Installing Features page appears and shows the progress of the tasks that are required to create a VSA cluster.
   Depending on the number of hosts that you selected, the VSA Installer wizard mounts two or three shared datastores on each ESXi host in the datacenter.

9 After the VSA Installer finishes creating the VSA cluster, click **Close**.
   The **VSA Manager** tab shows information about the VSA datastores, VSA cluster members, and the configuration of the VSA cluster network.

10 (Optional) Collect VSA installation logs.
   a Click **VSA Logs** anywhere in the wizard.
   b In the Export VSA Logs dialog box, click **Download VSA Logs**.
   c Navigate to a folder on the vCenter Server system and save the .zip file that contains the logs.

The VSA Installer wizard closes and the **VSA Manager** tab shows information about each datastore, VSA cluster member, and allows you to troubleshoot issues that might arise.
What to do next

Click the **Datastores** view and verify that all shared datastores have the same capacity and that their status is **Online**.

If the columns show correct data, you can start creating virtual machines and storing their files on the shared datastores.

**Automated Creation of a VSA Cluster**

The VSA Automated Installer includes vCenter Server, vSphere Client, vSphere Storage Appliance, VSA Manager, and an installation script that installs all components and creates a VSA cluster.

**VSA Automated Installer Requirements**

You can run the VSA Automated Installer on Windows Server 2003 and Windows Server 2008. Make sure that your Windows Server installation meets the VSA Automated Installer requirements before proceeding with the installation.

- Two or three physical servers that have ESXi installed and whose hard disks are configured in a RAID volume. VMware recommends that you use RAID5, RAID6, or RAID10 configuration.

  **Note** For more information about ESXi hardware requirements, see “VSA Cluster Requirements,” on page 22.

- A physical or virtual machine that runs Windows Server 2003 or Windows Server 2008. If you use a virtual machine, the virtual machine must not run on an ESXi host that you intend to add to a VSA cluster.

- The ESXi hosts and the Windows Server are the only running machines in the subnet

- 6GB free hard disk space

- Microsoft .NET Framework 3.5 SP1

- Windows Installer 4.5

- Internet Explorer 7 or higher (optional), required only for viewing information in the **VSA Manager** tab after the installation is completed

- Latest version of Adobe Flash (optional), required only for viewing information in the **VSA Manager** tab after the installation is completed

**Create a VSA Cluster with the VSA Automated Installer**

To perform automated installation of the VSA cluster, you can use the automated installer script and enter the required parameters.

**Prerequisites**

Verify that your environment meets the requirements to perform automated installation as described in “VSA Automated Installer Requirements,” on page 45.

**Procedure**

- On the Windows Server system, run the installation command from the automated installer package.

  The following example shows how to install a VSA cluster with two ESXi hosts, with two specified VLAN IDs, and the specified VSA cluster IP address as the starting IP address from a range of free and incremented IP addresses.

  ```
  install.exe -fv Front_End_VLAN_ID -bv Back_End_VLAN_ID -si VSA_Management_address -u ESXi_root_user -p ESXi_root_password -ei ESXi_Host_1_IP ESXi_Host_2_IP ESXi_Host_3_IP
  ```
The VSA automated installer scans the subnet for ESXi hosts for available IP addresses and performs silent installation of the VSA cluster components.

- vCenter Server 5.0 (if not already installed on the Windows system)
- vSphere Client 5.0 (if not already installed on the Windows system)
- VSA Manager
- VSA cluster service (installed, but used only if 2 ESXi hosts are available in the subnet)

After all components are installed, the installer performs the tasks to install a VSA cluster.

1. Creates a datacenter and adds the ESXi hosts to it.
2. Updates the network configuration of the ESXi hosts.
3. Deploys the vSphere Storage Appliance onto the ESXi hosts.
4. Starts the VSA cluster service if only 2 ESXi hosts were present.
5. Powers on each instance of vSphere Storage Appliance and creates the VSA cluster.
6. Mounts the VSA datastores to each ESXi host in the datacenter.

**IMPORTANT** Do not rerun the VSA automated installer after a VSA cluster has been created.

### VSA Automated Installer Options

The VSA Automated Installer accepts a set of arguments and values that you can use to customize the VSA cluster installation.

The following table shows the options that you can use to run the VSA Automated Installer.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Default Value</th>
<th>Description</th>
<th>Required or Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>-p, --esxPass &lt;value&gt;</td>
<td>No default value.</td>
<td>The root password of each ESXi host. The root password must be the same for all ESXi hosts.</td>
<td>Required</td>
</tr>
<tr>
<td>-u, --esxUser &lt;value&gt;</td>
<td>No default value.</td>
<td>The root account. Use root.</td>
<td>Required</td>
</tr>
<tr>
<td>-ei, --esxIPs &lt;value&gt;</td>
<td>No default value.</td>
<td>The IP addresses of the two or three hosts to use for the VSA cluster. For example: -ei 10.20.118.11 10.20.118.12 10.20.118.13</td>
<td>Optional</td>
</tr>
<tr>
<td>-si, --startIP &lt;value&gt;</td>
<td>No default value.</td>
<td>The first IP in the range used by the VSA cluster.</td>
<td>Optional</td>
</tr>
<tr>
<td>-fv, --frontendVlanId &lt;value&gt;</td>
<td>0</td>
<td>The VLAN ID for the front-end network.</td>
<td>Optional</td>
</tr>
<tr>
<td>-bs, --backendStartIP &lt;value&gt;</td>
<td>192.168.0.1</td>
<td>The start IP for the back-end network. The default value is 192.168.0.1. The back-end IP addresses must be in the 192.168.x.x private subnet.</td>
<td>Optional</td>
</tr>
<tr>
<td>-bn, --backendNetmask &lt;value&gt;</td>
<td>255.255.255.0</td>
<td>The netmask for the back-end network.</td>
<td>Optional</td>
</tr>
<tr>
<td>-bv, --backendVlanId &lt;value&gt;</td>
<td>0</td>
<td>The VLAN ID for the back-end network.</td>
<td>Optional</td>
</tr>
<tr>
<td>-vn, --vmotionNetmask &lt;value&gt;</td>
<td>255.255.255.0</td>
<td>The netmask for the ESXi feature network.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
Table 3-2. install.exe Arguments (Continued)

<table>
<thead>
<tr>
<th>Parameters</th>

</tr>
</tbody>
</table>

Verify the VSA Datastores

After you create the VSA cluster, verify that the correct number of VSA datastores appears in the vSphere Client.

Procedure

1. In the vSphere Client, select View > Inventory > Datastores and Datastore Clusters.
   The number of VSA datastores must match the number of ESXi hosts that you added to the VSA cluster.
2. Select each datastore and click the Summary tab.
3. Verify that all datastores have the same total, free, and used capacity in the Capacity panel.
4. Select each datastore and click the Hosts tab.
5. In the Datastore column verify that the status of each datastore is Mounted for each ESXi host in the datacenter.
   The Mounted status shows that each ESXi host has access to and can read and write on the matching datastore.

What to do next

You can start deploying virtual machines on the VSA datastores.
Delete a VSA Cluster

VSA Manager provides a cleanup script that you use to delete a VSA cluster if you no longer use it or to clean up the ESXi hosts configuration if you failed to create a VSA cluster and want to make another attempt.

You cannot delete the VSA cluster by uninstalling VSA Manager. To delete the VSA cluster, you must use the cleanup.bat script that is installed by VSA Manager.

Procedure

1. In Windows Server 2003 or 2008, start the Command Prompt.
2. In the Command Prompt, change directory to the directory of the cleanup.bat script.
   
   `cd C:\Program Files\VMware\Infrastructure\tomcat\webapps\VSAManager\WEB-INF\test\tool`
3. Run the cleanup.bat script and provide Administrator credentials for vCenter Server.

   `cleanup.bat user password`

   The cleanup.bat script unmounts and deletes the VSA datastores, stops and deletes the VSA virtual machines, and reverts the ESXi hosts to their default configuration. The script removes additional virtual switches and uplinks and preserves only the default port groups for the default virtual switch. After the process finishes, the ESXi hosts might appear with an alert icon in the vCenter Server inventory. This is because the script deletes the redundant uplinks for the default virtual switch. The VSA Manager tab shows a message that the VSA cluster is now unavailable.
4. Clear the uplink redundancy alarms for each ESXi host.
   a. From the vCenter Server inventory, select an ESXi host that has an alert icon and select the Alarms tab.
   b. In the Alarms tab, right click the Network uplink redundancy lost alert and select Clear.
      The alert icon disappears from the selected ESXi host.
   c. Repeat the steps for the remaining ESXi hosts.
5. Refresh the VSA Manager tab by restarting the vSphere Client and the Tomcat Web service.
   a. Quit the vSphere Client.
   b. In the Command Prompt, type `net stop vctomcat` and press Enter to stop the Tomcat Web service.
      The Tomcat Web service stops.
   c. In the Command Prompt, type `net start vctomcat` and press Enter to restart the Tomcat Web service.
      The Tomcat Web service starts.
   d. Start the vSphere Client, select the VSA datacenter, and select the VSA Manager tab.
      The VSA Manager tab shows the VSA Installer wizard.

What to do next

You can now attempt to create a new VSA cluster with the same ESXi hosts.
Post-Installation Considerations for a VSA Cluster

When you have installed the VSA cluster, you can start deploying virtual machines on the ESXi hosts and use the VSA datastores. You can also ensure that the VSA cluster is running as expected by monitoring and administering it through VSA Manager.

- Review the VSA Manager interface and inspect the information that it provides.
- For information about deploying virtual machines, see the *vSphere Virtual Machine Administration* document.
- For each virtual machine that you deploy on the ESXi hosts that participate in the VSA cluster, ensure that you reserve the configured amount of memory. As VSA datastores do not support VMX swapping, this practice helps you to prevent memory overcommitment in the VSA cluster. For more information about preventing memory overcommitment, see the *VMware vSphere Storage Appliance Administration* document.
- For information about maintenance, monitoring, and troubleshooting the VSA cluster, see the *VMware vSphere Storage Appliance Administration* document.
